Ivanti Connect Secure CVE-2026-111357 Exposure Revalidation - Daily Update

1. Executive Summary

CVE-2026-111357 is an Ivanti Connect Secure missing-authentication-for-critical-function issue that CISA included in KEV in its 30 October update. CISA and Rapid7 reporting keep this a priority exposure and post-compromise validation task for every Connect Secure owner today. Rapid7 describes CWE-306 and CVSS v3.1 8.8; exact fixed-build selection must be validated against the current Ivanti advisory before change execution.

This 7 November daily revalidation found no new vendor advisory in the current-source search; it is deliberately a dated exposure and compromise-assessment update, not a claim of newly disclosed exploitation. Remote-access appliances sit at a high-value boundary: historical logs, administrative configuration, identity integrations, and network paths must be assessed alongside patch state. Related CVE-2026-118527 is included as chain context, not as a substitute for CVE-2026-111357 remediation.

2. Vulnerability Metadata

Field	Value
CVE	CVE-2026-111357
Product / Component	Ivanti Connect Secure
Weakness	Missing Authentication for Critical Function (CWE-306)
Severity	Rapid7 reports CVSS v3.1 8.8; operationally high priority
Exploitation Status	CISA KEV inclusion (2026-10-30)
Related CVE	CVE-2026-118527; assess chaining context
Fixed Builds	Validate against current Ivanti/CISA guidance; supporting sources cite 25.1.1.3 and 22.8R2.6

3. Source Review & Confidence

Source	Contribution	Confidence
CISA advisory	KEV status, affected-version update, remediation priority	High
Rapid7	CWE/CVSS and technical remediation context	High
BleepingComputer	Supporting chaining/reporting context	Medium
CISA KEV alert	Catalog-addition confirmation	High

The prioritization is high confidence. Exact exploit sequence, appliance configuration impact, and final fixed-build applicability should be verified against Ivanti's current advisory during maintenance planning.

4. Vulnerability Details

The issue affects a security boundary in a remote-access appliance. Missing authentication for a critical function can enable an attacker who reaches the relevant functionality to gain capabilities beyond intended authorization. Security teams should not

infer internet exposure solely from DNS records: enumerate load balancers, alternate portals, disaster-recovery appliances, and legacy management endpoints.

5. Attack Scenarios

1. An exposed Connect Secure appliance is targeted, then administrative or system-level access is pursued through the vulnerable function.
2. An attacker chains a related weakness with this issue to place a file, alter configuration, or establish persistence.
3. A patched appliance retains suspicious administrative changes, identity integration settings, or outbound connections created before remediation.

6. Threat Landscape & Exploitation Status

CISA KEV inclusion indicates evidence of exploitation and warrants accelerated action. This report does not attribute activity to a named actor. Treat the appliance as a potential initial-access boundary and assess adjacent identity, VPN, and management-plane logging for the preceding retention period.

7. Affected Products and Exposure

Exposure Pattern	Why It Matters	Action
Internet-facing remote access	Directly accessible initial-access boundary	Patch, restrict access, and investigate
HA/DR appliance	Often omitted from normal inventory	Validate version and configuration separately
Admin interface reachable from broad internal segments	Enables lateral misuse after an initial foothold	Segment and restrict administration
Patched appliance with weak logging	Compromise assessment remains incomplete	Export logs and review configuration history

8. Mitigation and Workarounds

Priority	Owner	Action
Critical	Network/security engineering	Identify every Connect Secure instance and apply Ivanti-supported fixed builds.
Critical	SOC / IR	Preserve appliance, VPN, authentication, and administrative logs before cleanup.
High	Identity team	Review privileged accounts, MFA enforcement, SAML/LDAP changes, and unusual session patterns.
High	Network team	Restrict administrative access and remove unnecessary public exposure.

9. Detection Engineering

Signal	Telemetry Source	Analytic Goal
New/changed privileged or local appliance account	Appliance audit logs	Identify persistence or unauthorized admin activity
Admin configuration export or change	Appliance/syslog	Identify control-plane tampering

outside window		
Unusual VPN admin session or egress from appliance	VPN/NetFlow/proxy	Identify follow-on access or staging

```
title: Ivanti Connect Secure Administrative Configuration Change Outside Change Window
status: experimental
logsource:
  product: network
  service: vpn
detection:
  keywords:
    - 'administrator'
    - 'configuration changed'
    - 'local user created'
  condition: keywords
level: high
```

```
DeviceNetworkEvents
| where Timestamp > ago(30d)
| where RemoteUrl has_any ('/api/v1','/admin','/dana-admin')
| where InitiatingProcessFileName in~ ('sslvpn','ivanti','unknown')
| project Timestamp, DeviceName, RemoteUrl, RemoteIP, InitiatingProcessFileName
```

10. Threat Hunting

Hypothesis: an exposed or formerly exposed appliance was used to create administrative state, make unexpected identity changes, or initiate anomalous outbound activity.

```
index=vpn (sourcetype=ivanti* OR host=*connect*secure*)
("user created" OR "administrator" OR "configuration changed" OR "export")
| stats count values(user) values(src_ip) values(action) by host _time
| sort - _time
```

Correlate events with approved maintenance tickets, IdP audit logs, firewall sessions, and endpoint activity associated with VPN-assigned addresses.

11. MITRE ATT&CK Mapping

Technique	Name	Evidence / Rationale
T1190	Exploit Public-Facing Application	Relevant to exposed appliance attack path; not confirmation of compromise.
T1078	Valid Accounts	Hunt focus for anomalous administrator/VPN sessions.
T1098	Account Manipulation	Hunt focus for unauthorized identity or privilege changes.

12. Validation / Lab Testing

No exploit was executed. Detection logic is intentionally generic because appliance log fields vary by deployment and firmware. Validate parsers, timestamps, retention, and change-window enrichment before alerting.

13. Recommended Actions Summary

Priority	Owner	Action
Critical	CISO delegate	Obtain accountable confirmation of inventory, fixed build, and exposure status.
Critical	SOC/IR	Complete compromise assessment for

		exposed systems.
High	IAM	Review privileged sessions and identity integration changes.
