CVE-2026-85880 Windows ALPC Zero-Day Daily Prioritization Update

CVE / Vulnerability Threat Intelligence Report

Classification	TLP:CLEAR
Published	2026-09-14
Version	1.0
Author	Lost Boys Cyber
Report Type	CVE / Vulnerability Threat Intelligence Report

TLP:CLEAR | Lost Boys Cyber | CVE-2026-85880 Windows ALPC Zero-Day Daily Prioritization Update - CVE / Vulnerability Threat Intelligence Report

Published: 2026-09-14 | TLP:CLEAR | Version: 1.0 | Author: Lost Boys Cyber

AI Generation: This report was generated with AI assistance and is provided for informational purposes only. All findings, IOCs, detection rules, hunting queries, attribution assessments, and recommendations must be independently reviewed and validated by a qualified security professional before operational use.

Table of Contents

1. Executive Summary
2. Vulnerability Metadata
3. Source Review and Confidence
4. Vulnerability Details
5. Attack Scenarios
6. Threat Landscape and Exploitation Status
7. Affected Products and Exposure
8. Mitigation and Workarounds
9. Detection Engineering
10. Threat Hunting
11. MITRE ATT&CK Mapping
12. Validation / Lab Testing
13. Recommended Actions Summary
14. References

CVE-2026-85880 Windows ALPC Zero-Day Daily Prioritization Update

1. Executive Summary

BLUF: Windows ALPC privilege-escalation activity associated with exploit-kit reporting requires urgent Patch Tuesday validation and endpoint behavioral hunting. This is a current-day Lost Boys Cyber prioritization update for 2026-09-14; it is not a claim of a new same-day disclosure unless the cited source says so. The reporting window was expanded to the last 7 days where required to preserve source quality.

Field	Value
Priority	Top 2 vulnerability coverage for 2026-09-14
Severity	Critical
Confidence	Medium-High
Primary Exposure	Windows endpoint/server fleets, privileged access workstations, terminal servers, and VDI.
Defender Outcome	Patch verification, exposure reduction, telemetry review, and executive tracking

2. Vulnerability Metadata

Field	Signal
Tracked Item	CVE-2026-85880 Windows ALPC Zero-Day Daily Prioritization Update
Known Exploitation	Prioritize as actively exploited or exploitation-associated where cited by CISA/vendor reporting
Affected Surface	Windows endpoint/server fleets, privileged access workstations, terminal servers, and VDI.
Exploit Preconditions	User interaction, local access, vulnerable endpoint/software state, or adjacent exploit chain depending on cited CVE details
Operational Risk	Initial access enablement, privilege escalation, defense evasion, or follow-on hands-on-keyboard activity

3. Source Review and Confidence

#	Source	URL	Role
1	Microsoft September 2026 Patch Tuesday summary (Arctic Wolf)	https://arcticwolf.com/resources/blog/microsoft-patch-tuesday-security-recap-september-2026-edition/	Used for corroboration and defender context
2	CrowdStrike September 2026 Patch Tuesday analysis	https://www.crowdstrike.com/en-us/blog/patch-tuesday-analysis-september-2026/	Used for corroboration and defender context
3	BleepingComputer BlueMoon exploit-kit coverage	https://www.bleepingcomputer.com/	Used for corroboration and

		news/security/new-blumoon-kit-exploited-windows-and-chrome-zero-day-flaws/	defender context
4	The Hacker News exploit-kit coverage	https://thehackernews.com/2026/09/four-spy-groups-used-same-chrome-and.html	Used for corroboration and defender context

Confidence is Medium-High because the item is corroborated across authoritative or reputable sources. Where secondary reporting is used, defenders should verify final affected-product details against the vendor advisory before change-control closure.

4. Vulnerability Details

Windows ALPC privilege-escalation activity associated with exploit-kit reporting requires urgent Patch Tuesday validation and endpoint behavioral hunting. The practical defender question is not only whether a patch exists, but whether vulnerable assets remain reachable, whether exploit-precondition controls are reliable, and whether endpoint telemetry can expose attempted exploitation or suspicious post-exploitation behavior.

Control Area	Priority Check	Evidence to Collect
Asset Inventory	Identify affected products and versions	EDR inventory, vulnerability scanner plugin results, CMDB, MDM
Patch State	Confirm successful deployment and reboot state	Patch reports, device timeline, server maintenance records
Exploit Mitigations	Confirm attachment, browser, macro, and local privilege controls	GPO/Intune baselines, attack-surface-reduction events
Monitoring	Hunt for exploitation and follow-on behavior	EDR, identity, proxy, email, and vulnerability telemetry

5. Attack Scenarios

Scenario	Description	Defensive Pivot
Opportunistic exploitation	Actors reuse public guidance or exploit-kit logic after disclosure	Internet-edge and endpoint coverage gaps
Targeted exploitation	Operators select high-value users or systems and chain with credential theft	VIP endpoint telemetry, identity anomalies
Post-exploitation escalation	Local privilege escalation or payload staging follows initial foothold	Process lineage, suspicious services/tasks, token abuse

6. Threat Landscape and Exploitation Status

This item is selected because current public reporting places it in the active-exploitation or high-urgency patch window. Treat the observable list below as analytic pivots, not complete IOCs.

Observable	Type	Action
CVE-2026-85880	Observable / analytic pivot	Validate in SIEM, EDR, vulnerability, and ticketing systems
Windows ALPC	Observable / analytic pivot	Validate in SIEM, EDR, vulnerability, and

		ticketing systems
BlueMoon exploit kit	Observable / analytic pivot	Validate in SIEM, EDR, vulnerability, and ticketing systems

7. Affected Products and Exposure

Segment	Exposure Path	Aviation/Aerospace Relevance
Enterprise endpoints	User-driven document, browser, or local exploit paths	Flight operations, engineering, MRO, and executive endpoints often carry sensitive data
Servers / VDI	Delayed patch windows and shared-user density	Disruption to dispatch, reservation support, and supplier connectivity
Third parties	Managed endpoints and contractors	Supplier compromise can bypass direct perimeter assumptions

8. Mitigation and Workarounds

Action	Owner	Timing
Validate patches against authoritative vendor guidance	Vulnerability management	24-72 hours
Identify remaining vulnerable assets and exceptions	IT operations	Daily until closed
Apply compensating controls for exceptions	Security architecture	Same day for internet/high-value assets
Brief service desk and SOC on exploitation pivots	Security operations	Same day

9. Detection Engineering

<pre>DeviceTvmSoftwareVulnerabilities where CveId has_any ("CVE-2026-85880") summarize AffectedDevices=dcount(DeviceId), Devices=make_set(DeviceName, 20) by CveId, SoftwareName, SoftwareVersion order by AffectedDevices desc</pre>
<pre>title: Suspicious Post Exploitation Activity After Priority Vulnerability Exposure status: experimental logsource: product: windows category: process_creation detection: selection: Image endswith: - '\powershell.exe' - '\cmd.exe' - '\rundll32.exe' - '\regsvr32.exe' filter_admin: ParentImage contains: - '\Windows\System32\svchost.exe' condition: selection and not filter_admin fields:</pre>

```

- Image
- ParentImage
- CommandLine
- User

```

level: medium

10. Threat Hunting

```

DeviceProcessEvents
| where Timestamp > ago(7d)
| where ProcessCommandLine has_any ("rundll32", "regsvr32", "mshta", "powershell -enc", "curl ",
"bitsadmin")
| summarize count(), Hosts=dcount(DeviceName), Samples=make_set(ProcessCommandLine, 10) by
InitiatingProcessFileName, FileName
| order by count_desc

```

Hunt intent: find suspicious child-process and script execution patterns on assets that remain vulnerable or were patched late.

11. MITRE ATT&CK Mapping

Technique	Rationale
T1203 Exploitation for Client Execution	Exploit-triggered execution where user-facing software is involved
T1068 Exploitation for Privilege Escalation	Local exploit chaining where applicable
T1059 Command and Scripting Interpreter	Common follow-on execution path
T1105 Ingress Tool Transfer	Payload staging after exploitation

12. Validation / Lab Testing

No exploit code was executed during this automated production run. Validation should use non-exploit checks: version inventory, vendor patch state, control evidence, and benign telemetry queries above.

13. Recommended Actions Summary

Priority	Action
P1	Patch or isolate exposed affected assets
P2	Hunt for exploit-chain and post-exploitation behavior in the last 14 days
P3	Record business exceptions with compensating controls and expiry dates
